

Getting the names of the children

Syntax:

```
Node._values
```

To get a list of all of a Node's children, simply use the `values` property:

```
Node._values
```

This will return a list of strings, not Nodes.

If you have a child Node named "`_values`", you will need to use the `get` function to retrieve it. See [here](#) for more details.

`.values` -> `._values` as of 1.0.0
